Lab No 3 Tasks

IFZA RIZWAN

SAP 64281

Lab Instructor: Saleha Nasim

Task 1:

What is Ethernet cable? What type Ethernet cable is most commonly used in LAN network?
03

ANSWER:

ETHERNET: It is a type of network cable use to connect computer, router, switches with in a local area network. It transmit wifi signals in form of electrical signals through twisted pair of cables.

Common use: It mostly used in LANs there are few types cat6, cat5e etc. we mostly used cat6 due to it fast speed of data transfer.

Task 2:

What is a LAN (local area network)? When and why to use LAN cable to send files from one computer to another? 04

ANSWER:

LAN: It is a type of network that connect devices like computer, printers and all devices that are internet dependent in small area like building schools, colleges, hospitals etc.

File sharing:

In Faster file sharing a LAN cable is used.

For secure file transfer LAN cable is used.

For stable connection a LAN cable is used.

Task 3:

How Does LAN Work? What is meant by 127.0.0.1 and localhost? 05

ANSWER:

LAN works: by connecting devices through a central device (like a switch or router), allowing them to communicate and share resources using network protocols (like TCP/IP).

127.0.0.1: is the **loopback IP address**, and **localhost** is its **hostname**. Both refer to the **computer you're currently using**. It is used for testing network applications without sending data over the actual network.

LAN: It is a type of network

Task 4:

How two computers can share files through disk sharing. 5

ANSWER:

Two computers can share files via disk sharing using these steps:

1. **Connect** both computers to the same LAN (wired or wireless).
2. On the host computer, enable file sharing:

Go to folder or drive > Right-click > Properties > Sharing tab > Share or Advanced Sharing.

3. Set permissions to allow access to specific users or everyone.
4. On the other computer, open File Explorer and enter the host's IP address or name.
5. Access the shared folder and transfer files as needed.

Task 5:

How to identify if two computers are connected to the same router? 03

ANSWER:

You can check if two computers are on the **same router/network** by:

1. **Checking IP addresses:**
 - On both computers, open Command Prompt and type: ipconfig.
 - If both have **similar IP addresses** but last number is different and the **same Default Gateway**, they are on the same router.
2. **Pinging each other:**
 - On one computer, open Command Prompt and type: ping <IP address of the other computer>.
 - If you get replies, they are connected.

THE END
